

# Binary Search Trees: Basic Operations

Daniel Kane

Department of Computer Science and Engineering  
University of California, San Diego

Data Structures  
Data Structures and Algorithms

# Learning Objectives

- Implement basic operations on Binary Search Trees.
- Understand some of the difficulties with making updates.

# Outline

- 1 Find
- 2 Next Element
- 3 Search
- 4 Insert
- 5 Delete

# Find

## Find

Input: Key  $k$ , Root  $R$

Output: The node in the tree of  $R$  with key  $k$

# Idea

Find(6)

# Idea

Find(6)

# Idea

Find(6)

# Idea

Find(6)

# Algorithm

Find( $k, R$ )

```
if  $R.\text{Key} = k$ :  
    return  $R$   
else if  $R.\text{Key} > k$ :  
    return Find( $k, R.\text{Left}$ )  
else if  $R.\text{Key} < k$ :  
    return Find( $k, R.\text{Right}$ )
```

# Missing Key

Run Find(5).

Key not in tree. Did find point where it should be.

# Missing Key

If you stop before reaching a null pointer, you find the place in the tree where  $k$  would fit.

# Modification

Find (modified)

```
else if  $R.\text{Key} > k$  :  
    if  $R.\text{Left} \neq \text{null}$ :  
        return Find( $k, R.\text{Left}$ )  
    return  $R$ 
```

# Outline

- 1 Find
- 2 Next Element
- 3 Search
- 4 Insert
- 5 Delete

# Adjacent Elements

Given a node  $N$  in a Binary Search Tree, would like to find adjacent elements.

# Next

## Next

Input: Node  $N$

Output: The node in the tree with the next largest key.

## Case I

If you have right child.

## Case II

No right child.

# Next

Next(*N*)

```
if N.Right  $\neq$  null:  
    return LeftDescendant(N.Right)  
else:  
    return RightAncestor(N)
```

# Left Descendant

LeftDescendant(*N*)

```
if N.Left = null  
    return N  
else:  
    return LeftDescendant(N.Left)
```

# Right Ancestor

RightAncestor( $N$ )

```
if  $N.Key < N.Parent.Key$   
    return  $N.Parent$   
else:  
    return RightAncestor( $N.Parent$ )
```

# Outline

- 1 Find
- 2 Next Element
- 3 Search
- 4 Insert
- 5 Delete

# Range Search

## Range Search

**Input:** Numbers  $x, y$ , root  $R$

**Output:** A list of nodes with key between  $x$  and  $y$

# Idea

RangeSearch(5, 12).

# Idea

RangeSearch(5, 12).

# Idea

RangeSearch(5, 12).

# Implementation

RangeSearch( $x, y, R$ )

$L \leftarrow \emptyset$

$N \leftarrow \text{Find}(x, R)$

while  $N.\text{Key} \leq y$

    if  $N.\text{Key} \geq x$ :

$L \leftarrow L.\text{Append}(N)$

$N \leftarrow \text{Next}(N)$

return  $L$

# Outline

- 1 Find
- 2 Next Element
- 3 Search
- 4 Insert
- 5 Delete

# Insert

## Insert

Input: Key  $k$  and root  $R$

Output: Adds node with key  $k$  to the tree

# Insert Idea

Insert(3)

# Insert Idea

Insert(3)

# Implementation

$\text{Insert}(k, R)$

$P \leftarrow \text{Find}(k, R)$

Add new node with key  $k$  as child of  
 $P$

# Outline

- 1 Find
- 2 Next Element
- 3 Search
- 4 Insert
- 5 Delete

# Delete

## Delete

Input: Node  $N$

Output: Removes node  $N$  from the tree

# Difficulty

Cannot simply remove.

Delete(13)

# Idea

# Idea

# Idea

# Idea

# Implementation

## Delete( $N$ )

```
if  $N.Right = \text{null}$ :
```

```
    Remove  $N$ , promote  $N.Left$ 
```

```
else:
```

```
     $X \leftarrow \text{Next}(N)$ 
```

```
     $X.Left = \text{null}$ 
```

```
    Replace  $N$  by  $X$ , promote  $X.Right$ 
```

# Problem

Which of the following trees is obtained when the selected node is deleted?

# Problem

Which of the following trees is obtained when the selected node is deleted?

# Next Time

Runtime and balance.
